

WGNE and Data Assimilation

Jean-Noël Thépaut
July 2012

WGNE ToRs

- Advise the JSC and CAS on progress in **atmospheric modelling**.
- Review the **development of atmospheric models for use in weather prediction and climate studies on all scales, including the diagnosis of shortcomings**.
- Propose numerical experiments aiming to refine numerical techniques and the **formulation of atmospheric physics processes, boundary layer processes and land surface processes in models**.
- Design and promote co-ordinated experiments for:
 - validating **model results against observed atmospheric properties and variations**;
 - **exploring the intrinsic and forced variability and predictability of the general circulation of the atmosphere on short to extended ranges**;
 - **assessing the intrinsic and forced variability of the atmosphere on climate time-scales**.
- **Promote the development of data assimilation methods for application to numerical weather and climate predictions, and for the estimation of derived climatological quantities**.
- Promote the development of **new methods for numerical weather prediction and climate simulation**.
- Maintain scientific liaison with other WCRP and CAS groups as appropriate.
- Promote the timely **exchange of information, data and new knowledge on atmospheric modelling** through publications, workshops and meetings.

Introduction (I)

- **WGNE has in its remits to support:**
 - Atmospheric modeling
 - Data assimilation developments
- **At the last WGNE session (WGNE-27 – Boulder Oct. 2011):**
 - Joint session with WGCM to explore areas of collaboration and expertise
 - Trends indicate progress in seamless prediction strategies
 - Same models for NWP and climate
 - Trans-AMIP initiatives
 - Systematic errors
- **WGNE initiatives are directly relevant for WDAC and WMAC**

Introduction (II)

- **Data assimilation combines models and observations and provides:**
 - **Verification facility**
 - **Essential tool for reanalysis and climate monitoring**
 - **Consistent framework for observation impact**
 - **Know-how on quality control, obs error characterisation, etc.**
- **This presentation is a (incomplete) digest of major events over the last year or so:**
 - **THORPEX DAOS (Exeter, June 2011), ECMWF annual seminar (September 2011), WMO data impact workshop (May 2012)**
 - *WCRP reanalysis conference (May 2012) (→ see M. Bosilovich)*
- **We will concentrate on:**
 - **Progress in data assimilation methods**
 - **Observation Usage and Impact**

ECMWF SEMINAR

6–9 September 2011

Data assimilation for atmosphere and ocean

The seminar will provide a pedagogical review of recent advances in data assimilation covering the topics:

Data assimilation methods

Particle filters and other non-linear data assimilation methods

Flow dependent background error in 4D-Var

Extended Kalman Filter surface analysis

Hybrid variational/ensemble methods

Long window weak constraint 4D-Var

Ensemble data assimilation

Observation related aspects

The global observing system

Assimilation of satellite data

Reanalysis

Pre and post processing

Observation error specification

Diagnostics of data assimilation

Real data assimilation systems

Hydrological cycle aspects

Stratospheric data assimilation

Mesoscale data assimilation

Ocean data assimilation

*Coupled data assimilation:
chemistry, aerosol, ocean, mixed layer*

Efficient use of future computer architectures

For details of the programme see:

www.ecmwf.int/newssevents/seminars

Further information can be obtained from:

Els Kooij-Connally

Invited speakers

Sue Ballard (*University of Reading*)

Dale Barker (*Met Office*)

Massimo Bonavita (*ECMWF*)

Carla Cardinali (*ECMWF*)

Patricia De Rosnay (*ECMWF*)

John C. Derber (*NOAA/NCEP*)

Gerald Desroziers (*Météo-France*)

Mike Fisher (*ECMWF*)

Keith Haines (*ESSC, University of Reading*)

Lars Isaksen (*ECMWF*)

Andrew Lorenc (*Met Office*)

Jean-François Mahfouf (*Météo-France*)

Andrew M Moore (*University of California*)

Saroja Polavarapu (*University of Toronto*)

Paul Poli (*ECMWF*)

Florence Rabier (*Météo-France*)

Michele Rienacker (*NASA-GMAO*)

Adrian Simmons (*ECMWF*)

Chris Snyder (*UCAR*)

Peter Jan van Leeuwen (*University of Reading*)

Jeffrey S. Whitaker (*NOAA ESRL*)

- Data assimilation methods
- Observation related aspects
- Real data assimilation systems
- Efficient use of computer architectures

Historical Background:

What has been important for getting the best NWP forecast? *(over last 3 decades)*

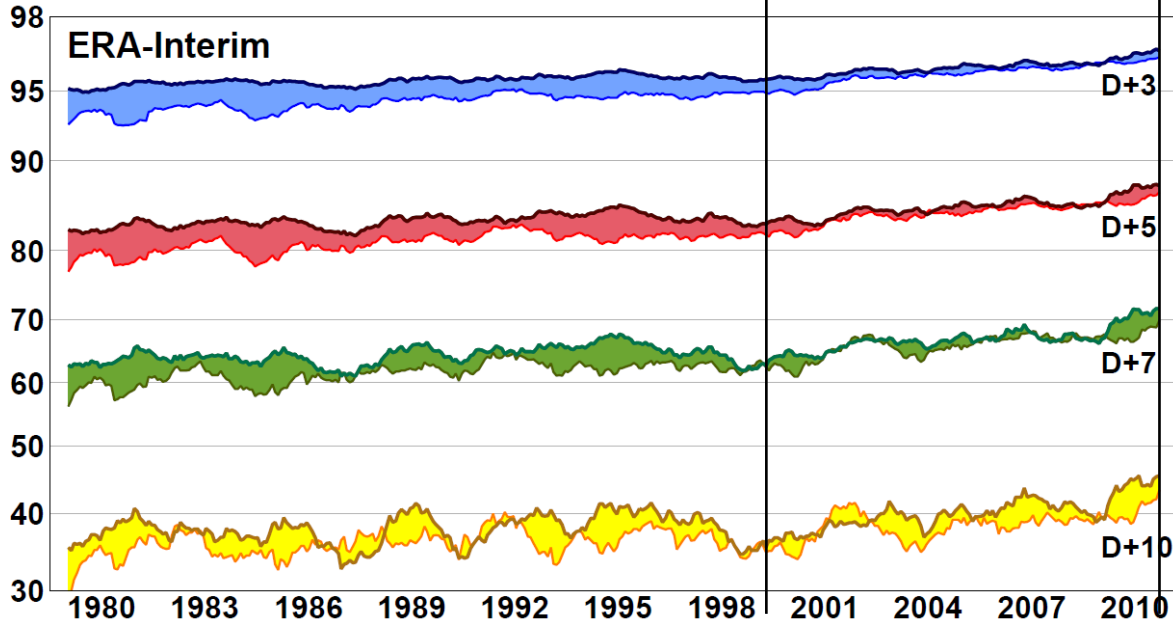

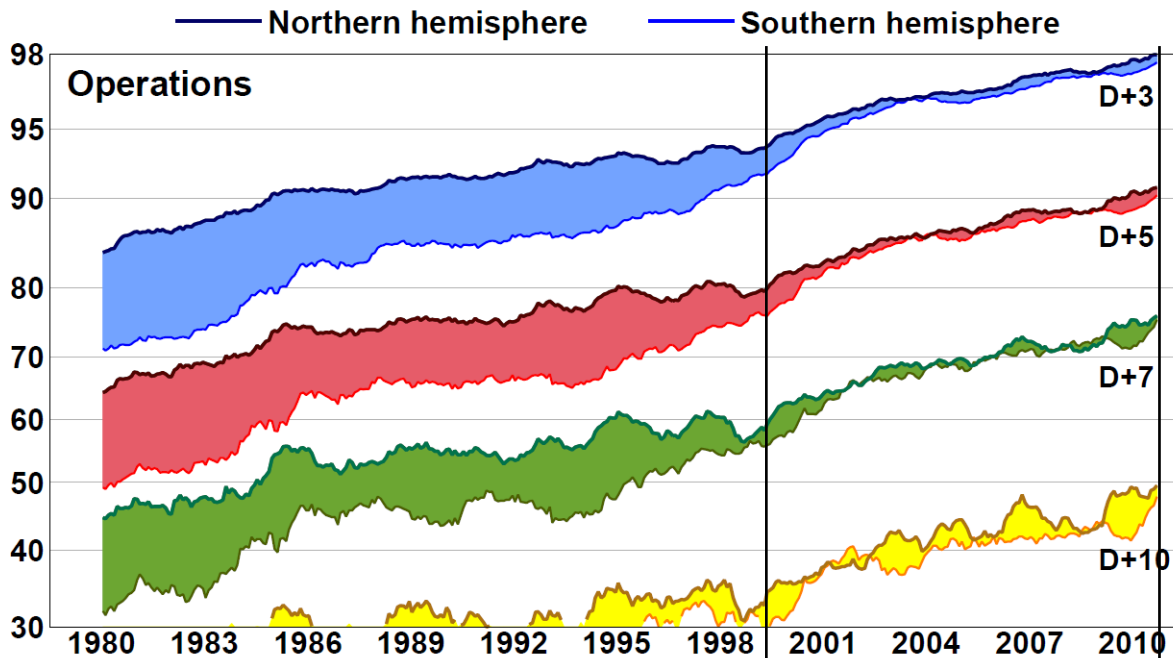

NWP systems are improving by 1 day of predictive skill per decade. This has been due to:

- 1. Model improvements, especially resolution.***
- 2. Careful use of forecast & observations, allowing for their information content and errors. Achieved by variational assimilation e.g. of satellite radiances. (Simmons & Hollingsworth 2002)***
- 3. Advanced assimilation using forecast model: 4D-Var***
- 4. Better observations.***

Andrew Lorenc

Anomaly correlation of 500hPa height forecasts

Statistical, incremental 4D-Var

optionally augmented by a model error correction term.

Andrew Lorenc

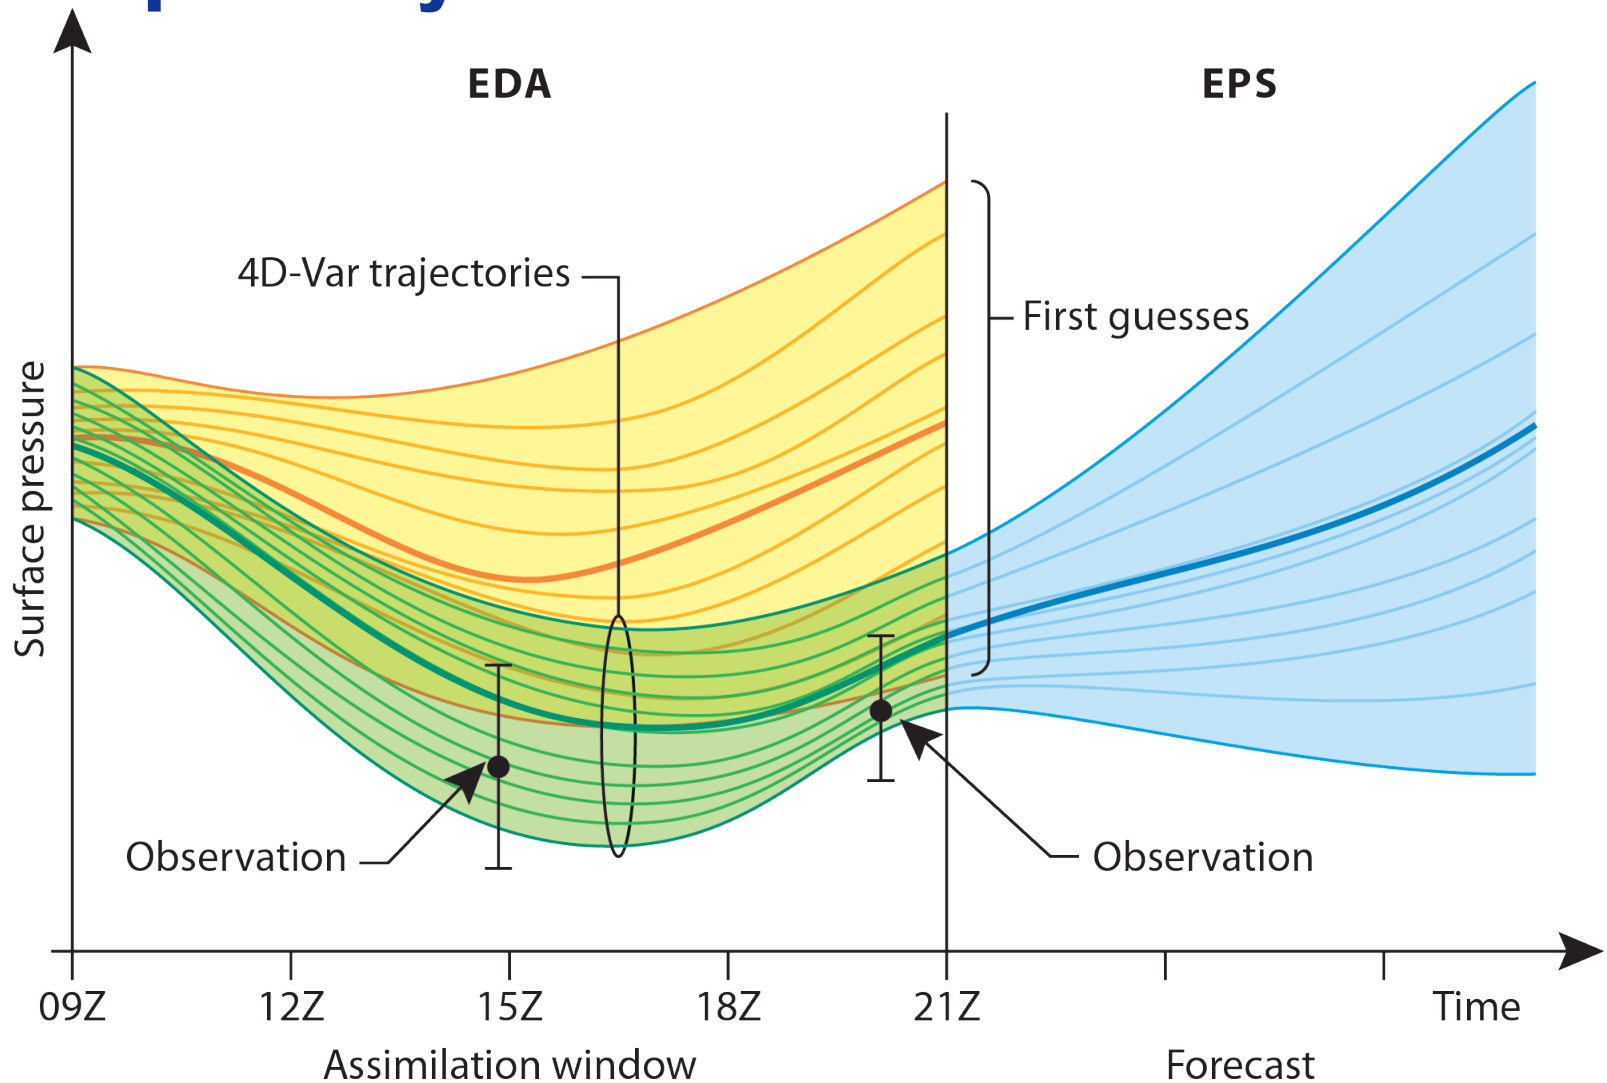

Hybrid Var/EnKF - best of both worlds?

Features from EnKF	Features from VAR
Extra flow-dependence in \mathbf{P}^b	Localization done correctly (in model space)
More flexible treatment of model error (can be treated in ensemble)	Reduction in sampling error in time-lagged covariances (full rank evolution of \mathbf{P}^b in assimilation window in 4DVar).
Automatic initialization of ensemble forecasts, propagation of covariance info from one cycle to the next.	Ease of adding extra constraints to cost function

--: covariance inflation,
covariance localization

--: scalability,
static B, maintenance cost

Example of Hybrid: Ensemble of data assimilation

- 10 members of 2 inner-loop 4D-Var's at T95/159 L91, T399 outer lops
- Perturbations from observations, SST, SPPT; noise filtering, scaling

Scalability – exploiting massively parallel computers

- 4D-Var as usually implemented requires *sequential* running of a reduced resolution linear PF model and its adjoint. It will be difficult to exploit computers with more (but not faster) processors to make 4D-Var run as fast at higher resolution.
- Improved current 4D-Var algorithms *postpone* the problem a few years, but it will probably return, hitting 4D-Var before the high-resolution forecast models.
- *4DCV 4D-Var can be parallelised over each CV segment, but is difficult to precondition well.*
- Ensemble DA methods run a similar number of model integrations in *parallel*. It is attractive to replace the iterated running of the PF model by precalculated ensemble trajectories: *4D-Ensemble-Var*. Other advantages of VAR can be retained.

Andrew Lorenc

Incremental 4D-Ensemble-Var

Andrew Lorenc

Trajectories of perturbations from ensemble mean

Full model evolves mean of PDF

Localised trajectories define 4D PDF of possible increments

4D analysis is a (localised) linear combination of nonlinear trajectories. It is not itself a trajectory.

Long window weak constraint 4D-Var

Suppose we extend the window by a few hours:

Parallelisation
over sub-windows

We expect very little change in the the analysis for the first sub-window:

Mike Fisher

Other active areas in DA

➤ Diagnostics for specifying observation error covariances in the assimilation

Gerald Desroziers

- Desroziers, Lonnerberg & Hollingsworth, etc.
- Effort in all centres to better characterize structure and amplitude

Diagnostics in observation space

(Desroziers et al, 2005)

- $d = y^o - H(x^b)$
- $d^{oa} = y^o - H(x^a)$
- $d^{ob} = H(x^a) - H(x^b)$
- $E[d^{oa} d^{oT}] = R$
- $E[d^{ob} d^{oT}] = HBH^T$
- $E[d^{ob} d^{oaT}] = HAH^T$
- $\langle \epsilon, \epsilon' \rangle = E[\epsilon \epsilon'^T]$

Other active areas in DA

➤ Enhanced diagnostics of assimilation and forecast performance (obs, R, B)

➤ The invisible world: pre- and post- processing in Data Assimilation

Transforming the raw data

Transforming into a different space

Averaging the data

Filtering the observations

Comparing model and observations

Monitoring and choice of observations

Bias correction

Removing wrong data

Thinning the data

Reducing data quantity and error correlation

Choosing the most relevant local data

Selective thinning depending on the flow

Filtering the analysis

Initialisation methods

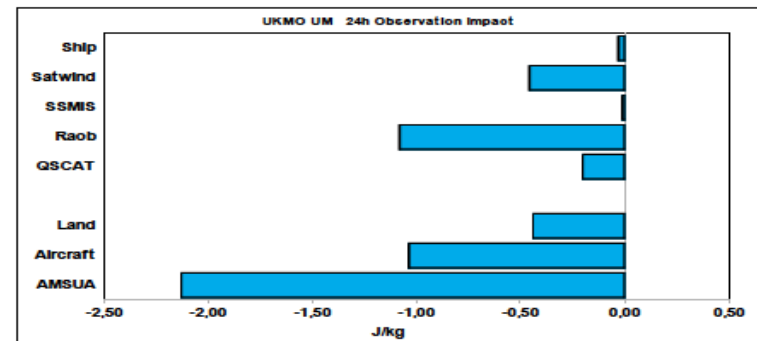

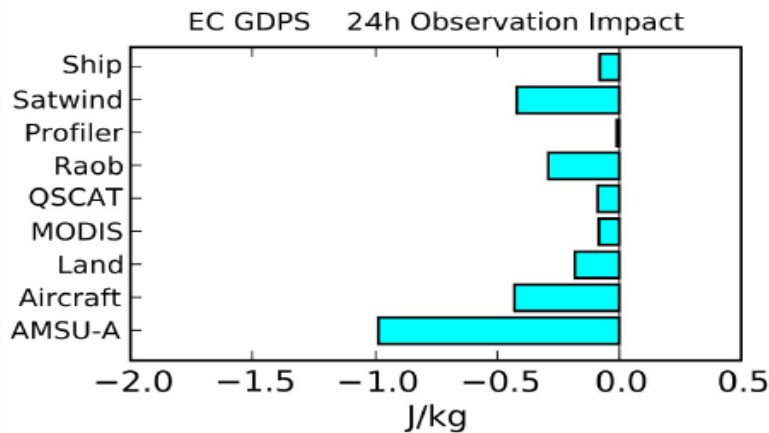

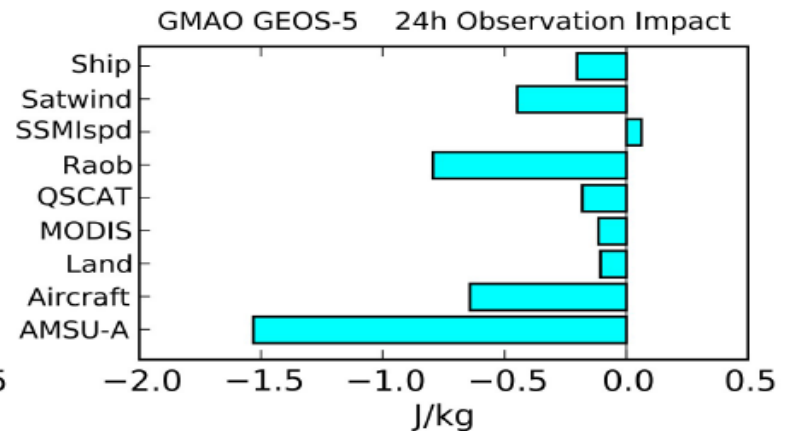

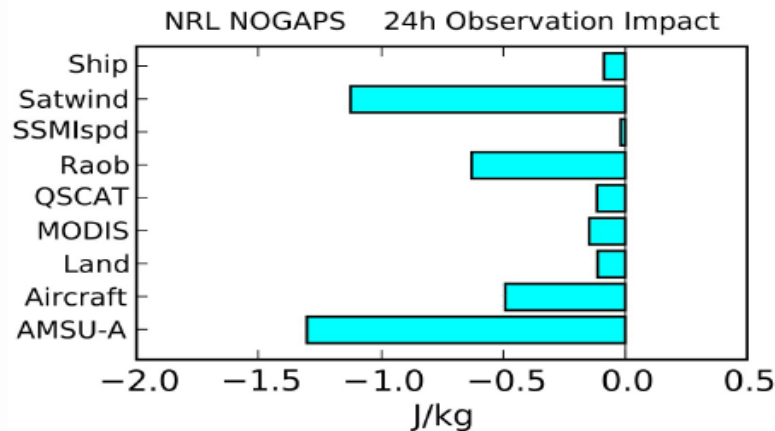

Influence on the analysis

Carla Cardinali

Florence Rabier

More widespread use of DFS and FSO types of diagnostics to evaluate impact of observations. Complementarity with OSEs

Impact of observation intercomparison: now including the Met-Office
D. Barker, M-O

Met-Office

Other active areas in DA: Ocean Data assimilation

Summary

- Ocean DA is diverse and mature
- Many basic challenges still exist:
 - expansion of control vector (B?)
 - tracer assimilation
 - initialization shock & filtering
 - vertical projection of satellite obs
 - covariance models
 - **biogeochemical data assimilation**
 - **model error**
 - **internal tides**
 - **quality control & bias correction**
 - **air-sea coupling at all scales**
- Sub-mesoscale and deep ocean are poorly observed (and poorly constrained)

Andy Moore

Other active areas in DA

➤ Regional aspects

- High resolution data assimilation, hydrometeors

➤ Challenge of satellite data assimilation

- Over land/sea-ice, use of PCs from hyper-spectral instruments, etc.

➤ Assimilation of the hydrological cycle

- e.g. coupling with land surface assimilation

➤ Ocean/atmosphere coupled data assimilation

- Systematic errors, time scales, etc.

➤ Nonlinear data assimilation

- Particle filters, etc.

➤ Reanalysis

- Requires specific DA formulation, not necessarily recycled from NWP
 - Longer window, highly time varying forecast error covariances, coupling

Conclusions and Suggestions (see also beginning)

- Impact studies (data denial or forecast error contributions) are a good tool to demonstrate the robustness of the GOS and to provide guidance on priorities for improved use of current data and of future missions
- WMO could enhance processes that:
 - maintain an up-to-date knowledge on impact of satellite data on NWP including guidance on interpretation (update cycle of this is tbd)
 - provide guidance for development work toward improved use of current data (that could also help to leverage dedicated funding)
 - provide guidance on future satellite missions (that does exist to large extent and is agreed => vision for the global GOS)
- *Longer term future:* WMO could trigger a concerted effort in support of the planning and coordination of a future space-based GOS from the very beginning

Adequate investment in R&D on utilisation of data
will increase the return on investment

Utilisation

Reanalysis and
climate
monitoring

Conclusions

- **WGNE initiatives are relevant to WDAC and WMAC**
 - Synergy or overlap? (something to watch out..)
 - **DA has an integrating role in providing consistent and qc-ed datasets for climate monitoring and therefore climate research (→ reanalysis)**
 - **DA provides unique tools to assess gaps in the G(C)OS**
 - How to assess observation impact for climate applications?
 - OSSEs in reanalysis mode?
 - **Progress in DA techniques will allow to address new challenges (→ coupled modeling and assimilation)**
 - **We have to make sure that DA developments for reanalyses are properly coordinated and promoted across WWRP and WCRP**
 - Reanalysis purely piggybacking on NWP DA is probably and obsolete hypothesis
 - Can WDAC/WGNE help ensuring this coordination?
-
