

# Multi-year prediction of ENSO

Jing-Jia Luo<sup>1\*</sup> (jingjia\_luo@hotmail.com),  
Hanh Nguyen<sup>1</sup>, Harry Hendon<sup>1</sup>, Oscar Alves<sup>1</sup>,  
Nick Dunstone<sup>2</sup>, Craig MacLachlan<sup>2</sup>

<sup>1</sup>Australian Bureau of Meteorology (BoM)

<sup>2</sup>UK Met Office

\*Now at Nanjing University of Science  
Information and Technology (NUIST), China

## Developing a multi-year prediction system at BoM:

1. ACCESS-S1: New BoM prediction system based on UK GC2 (60 km atmosphere + 25km ocean, high vertical resolutions)
2. Collaboration with UK Met Office: DePreSys3

### UKMO DePreSys3

- **16 months:** 1 Nov start date, every year during 1980-2014; 30 members
- **66 months:** 1 Nov start date, every 2-3 year during 1960-2014; 10 members

### JAMSTEC SINTEX-F

- **24 months:** start from 1<sup>st</sup> day of every month, 1982-2012, 9 members.

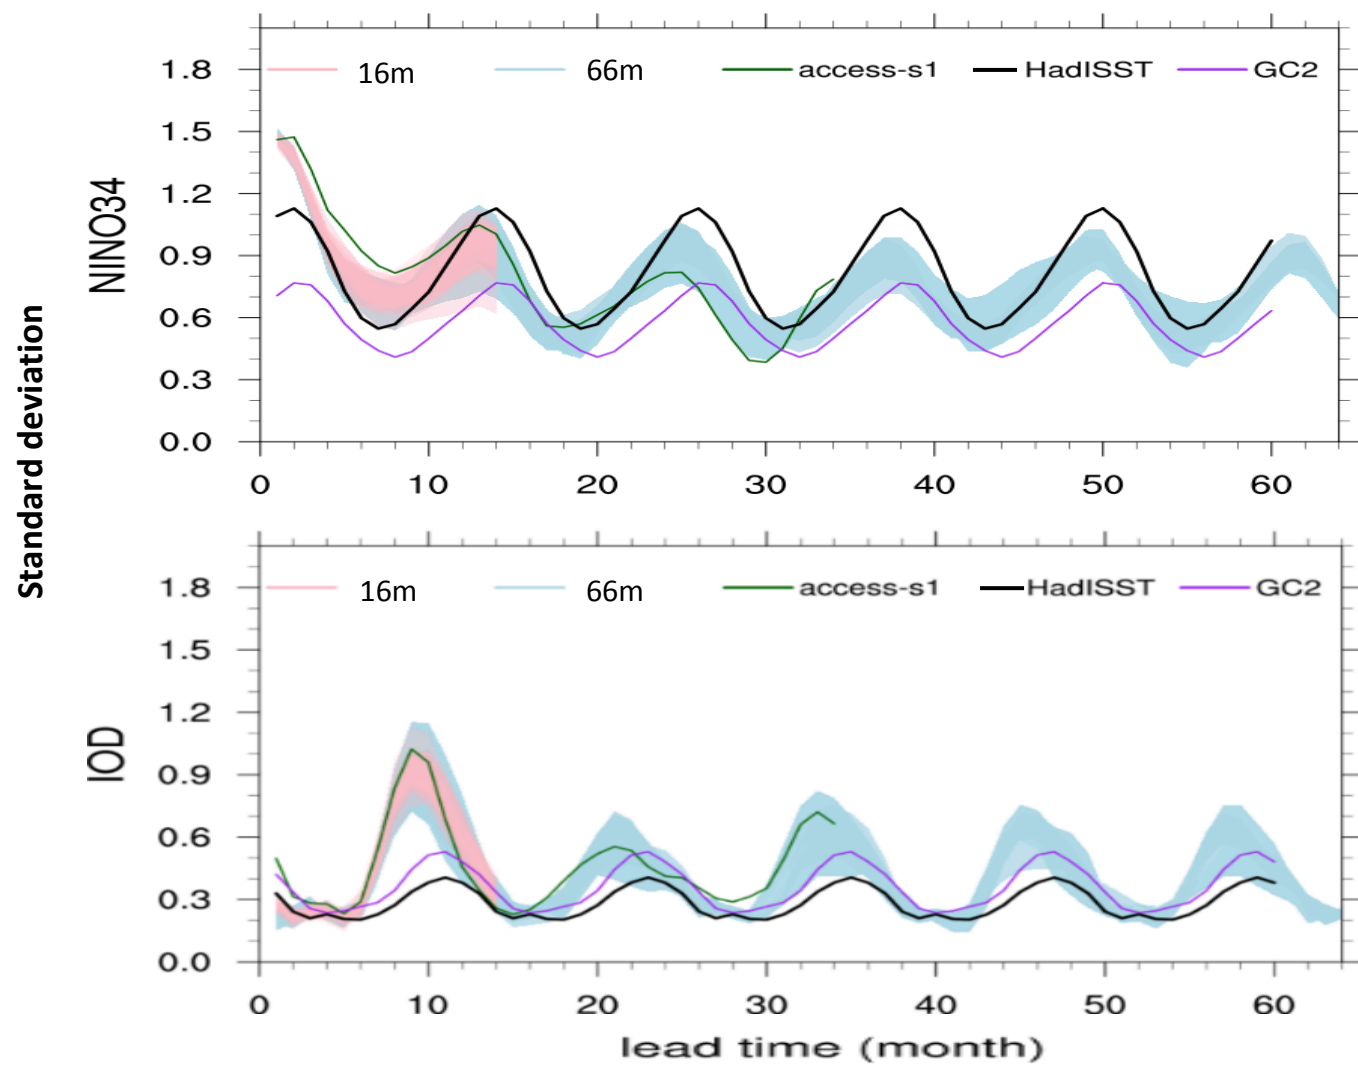

Climate drifts  
of SST and UV10:

66 months

Lead time

## Initial shock

2-year prediction of La Niña events (SINTEX-F):

# Real time forecasts (<http://www.jamstec.go.jp/frsgc/research/d1/iod/e/seasonal/outlook.html>)

SINTEX-F (9-member mean)

SINTEX-F (the 2007-09 La Niña)

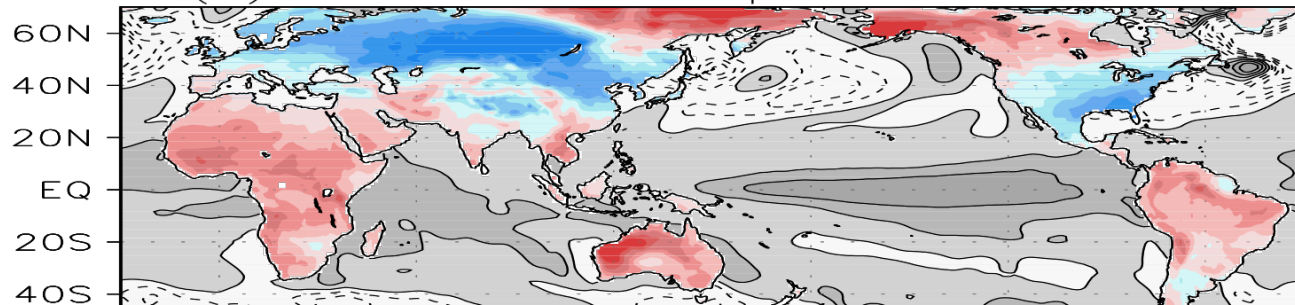

(a) Dec 2002–Feb 2003; observed

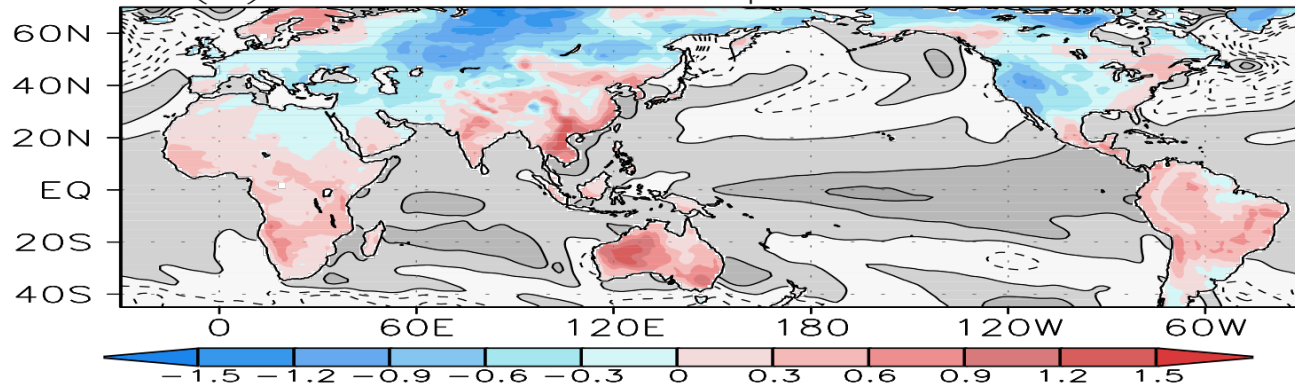

SSTA &  
2-m air  
temperature  
anomaly

(b) 18-month lead predicted

Contour interval is  
0.3°C

(c) 24-month lead predicted

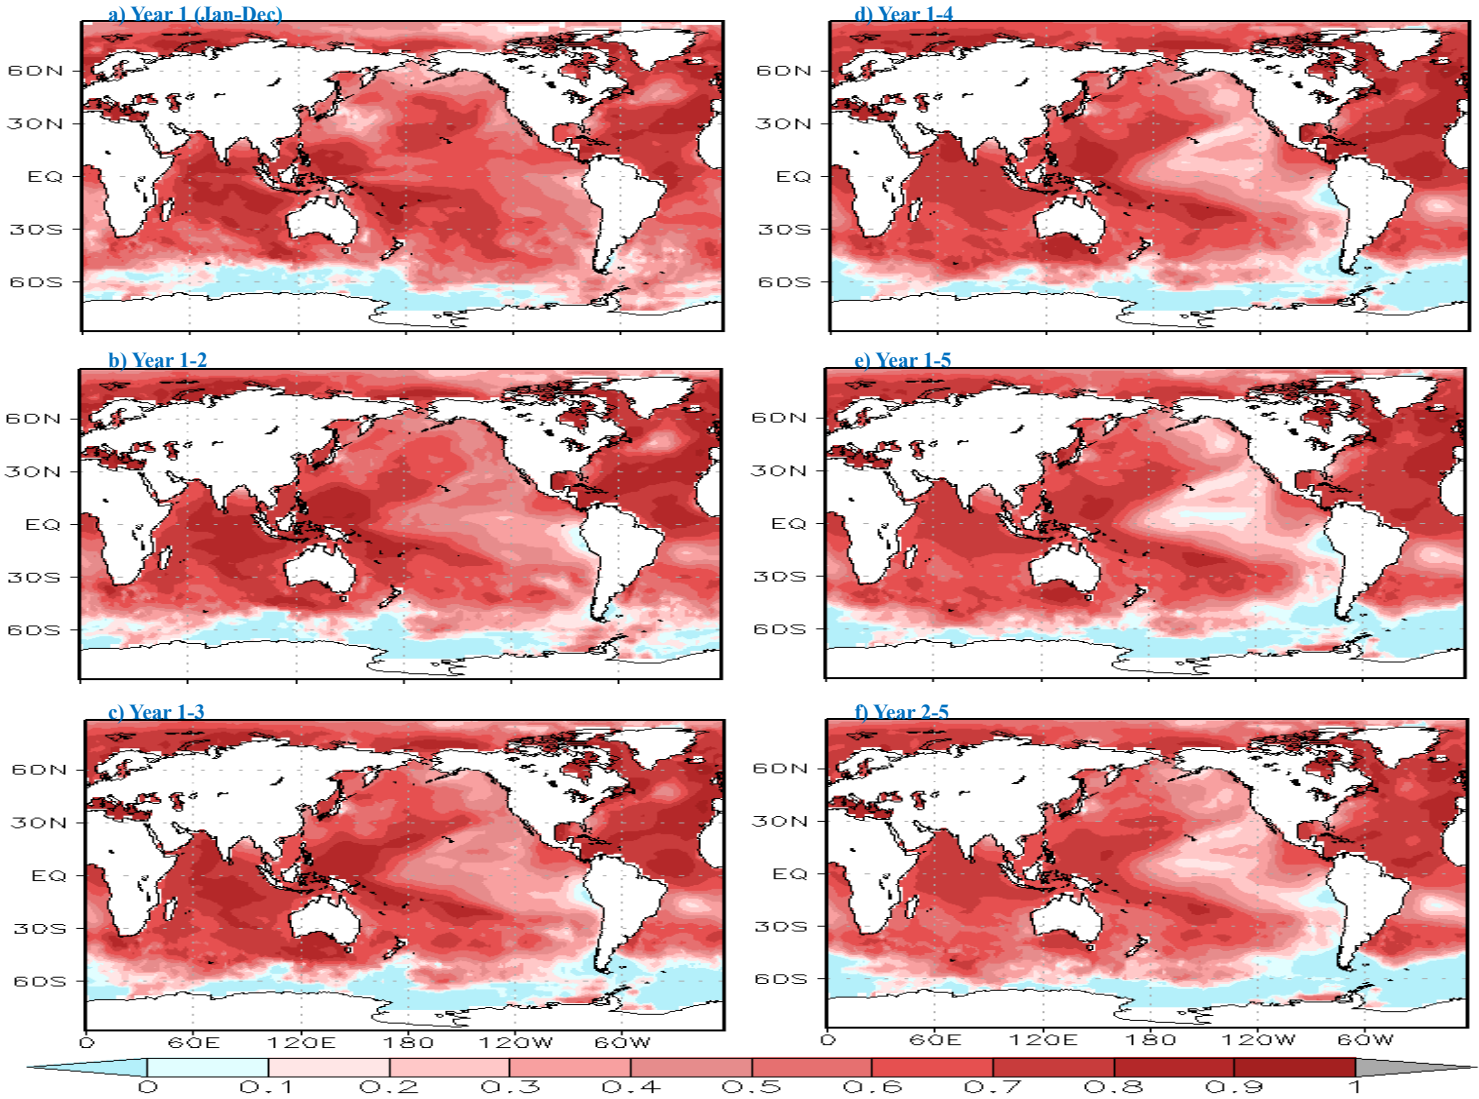

2-year lead ENSO prediction (SINTEX-F, 9 members):

Nino3.4 SSTA prediction ( $120^{\circ}$ - $170^{\circ}$ W,  $5^{\circ}$ S- $5^{\circ}$ N)

Prediction skill of multi-year mean SST anomaly

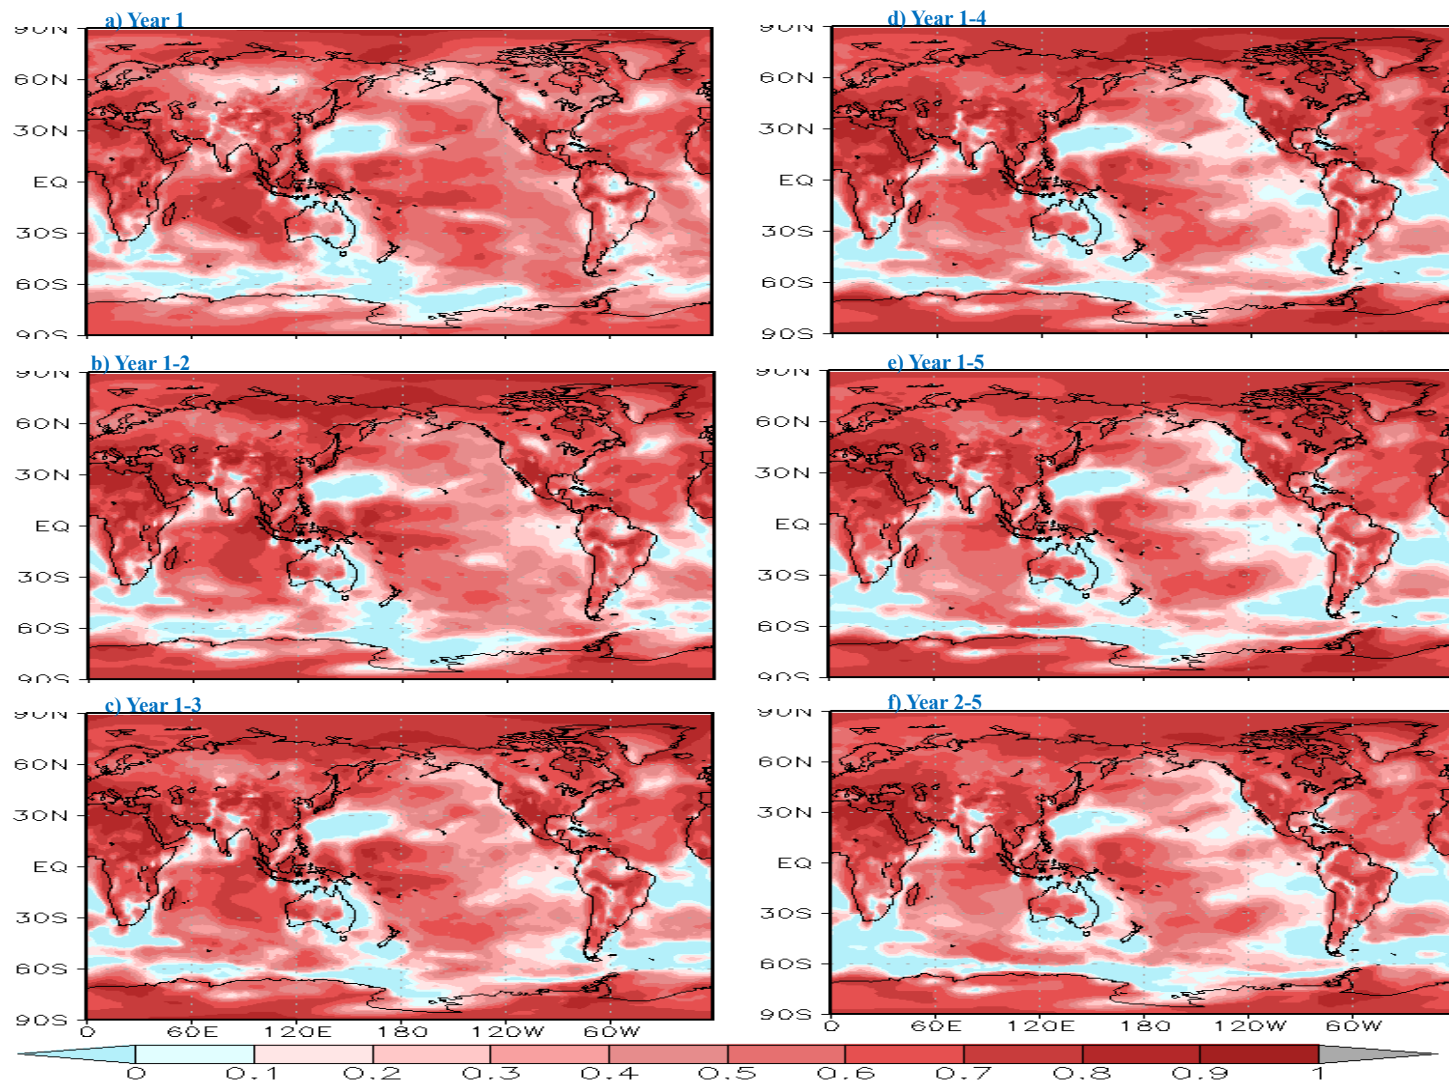

## Summary :

- ❖ Large climate drifts and initial shocks exist.
- ❖ ENSO can be skilfully predicted out to about 1.5 -2 years ahead.
- ❖ Multi-year mean temperature anomalies can be predicted at decadal time scale, particularly in the areas with strong warming trends.
- ❖ Prediction of precipitation is more challenging.

## Prediction skill of multi-year mean surface air temperature anomaly

## Prediction of surface air temperature anomaly

## Prediction of precipitation anomaly
