

Seasonal forecasts of the 20th Century: Multi-decadal variability in predictive skill of the winter NAO

Antje Weisheimer^{1,2}

¹*ECMWF*

²*University of Oxford*

With particular thanks to Chris O'Reilly², Damien Decremet¹ and Tim Palmer²

Introduction

How robust are winter NAO seasonal skill estimates if tested during independent past hindcast period? Can models successfully predict the NAO in earlier decades of the 20th Century? How confident are we to predict future winters?

Introduction

How robust are winter NAO seasonal skill estimates if tested during independent past hindcast period? Can models successfully predict the NAO in earlier decades of the 20th Century? How confident are we to predict future winters?

Re-forecast experiments over the period 1901-2010:

ECMWF's atmospheric model with prescribed SSTs and sea-ice (uncoupled)

Initial cond.: ECMWF atmospheric re-analysis of the 20th Century ERA-20C (*Poli et al., JCLIM 2016*)

See *Weisheimer et al. (QJ 2017)*, *O'Reilly et al. (GRL 2017)* and *Weisheimer et al. (QJ 2018 under rev.)*

ECMWF's fully coupled atmosphere-ocean-sea-ice model (coupled)

Initial cond.: New ECMWF coupled re-analysis of the 20th Century CERA-20C (*Laloyaux et al., JAMES 2018*)

- IFS model cycle 41R1 (in-between S4 and SEAS5), T_L255L91 (ca. 60km)) + **NEMO ORCA1L42 + LIM2**
- Ensemble with 51 perturbed members
- Focus here: 4-month forecast initialised on 1st of Nov each year (→ DJF)

Global mean (60°N-60°S) 2m temperature forecast anomalies in DJF

Bias and skill for Z500 in DJF

bias

1981-2009

uncoupled

coupled

S4

SEAS5

1901-2009

- Similar bias in uncoupled and coupled model
- consistent with biases of operational models

correlation skill

1981-2009

1901-2009

- Comparable levels of NH extratropical skill in uncoupled, coupled and operational models

Multi-decadal variability of NAO forecast skill (moving window)

$$r_{1901-2009} = 0.31$$

Multi-decadal variability of NAO forecast skill (moving window)

$$r_{1901-2009} = 0.31$$

Multi-decadal variability of NAO forecast skill (moving window)

$$r_{1901-2009} = 0.31 \quad r_{1901-2009} = 0.28$$

Multi-decadal variability of Z500 correlation skill in DJF

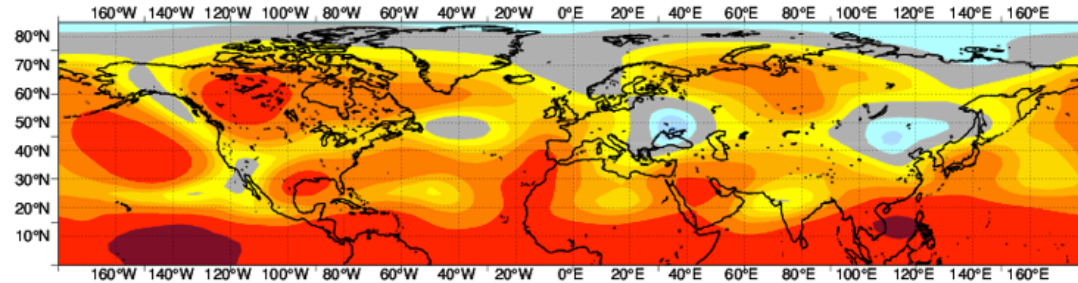

Does the model underestimate the skill?

observed predictability

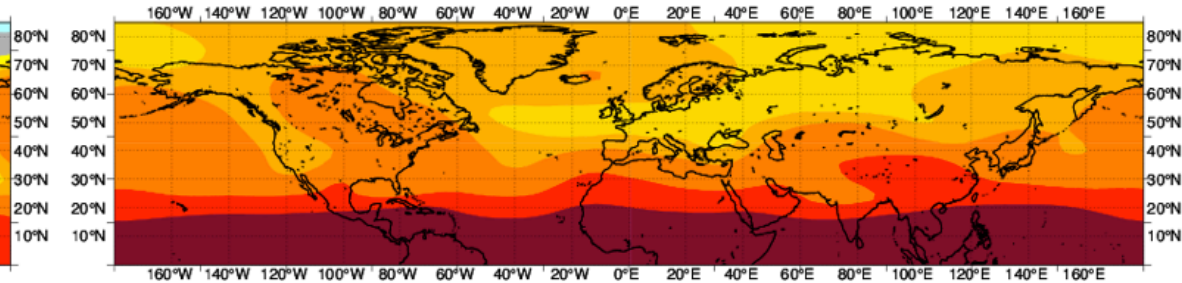

model predictability (perfect model)

1912-1940

(a) Observed correlation skill (ACC) for ASF-20C (1912~1940)

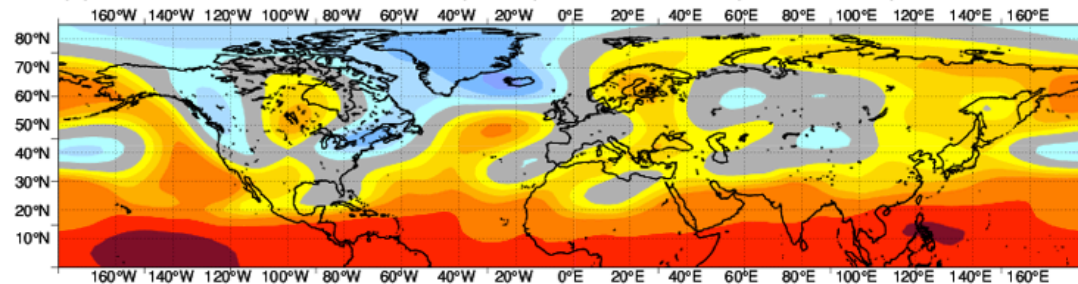

(b) Perfect model correlation skill (ACP) for ASF-20C (1912~1940)

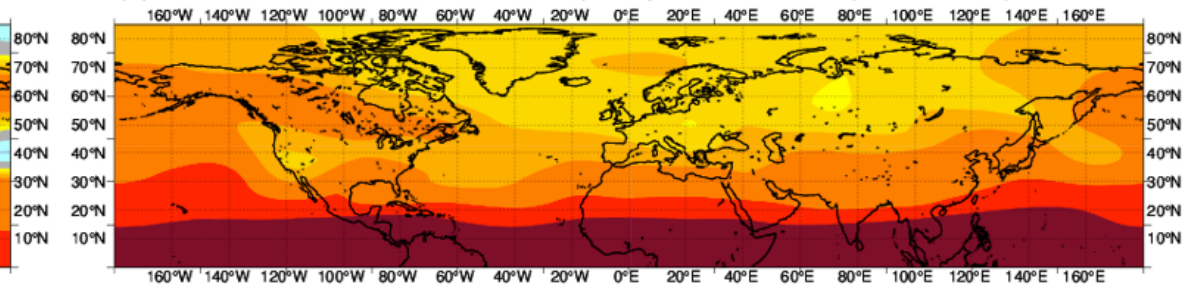

1942-1970

(c) Observed correlation skill (ACC) for ASF-20C (1942~1970)

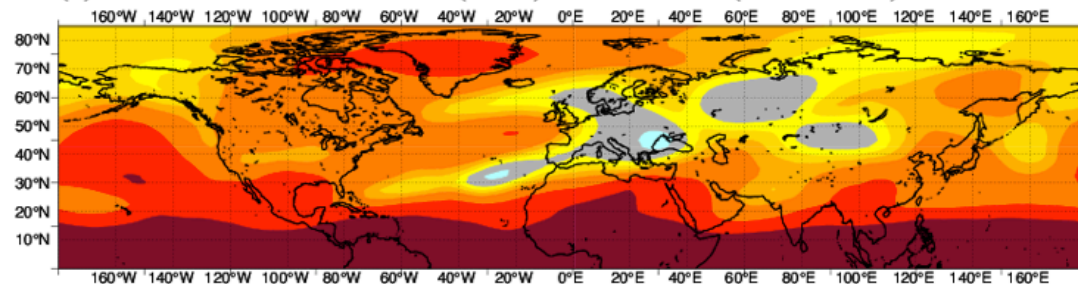

(d) Perfect model correlation skill (ACP) for ASF-20C (1942~1970)

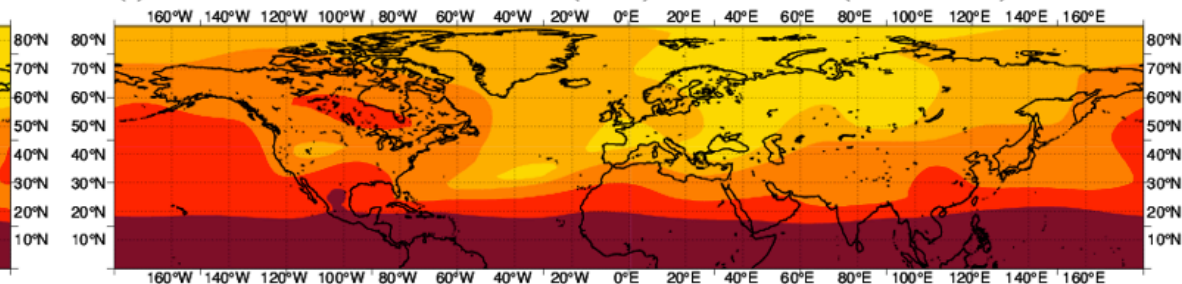

1981-2009

(e) Observed correlation skill (ACC) for ASF-20C (1981~2009)

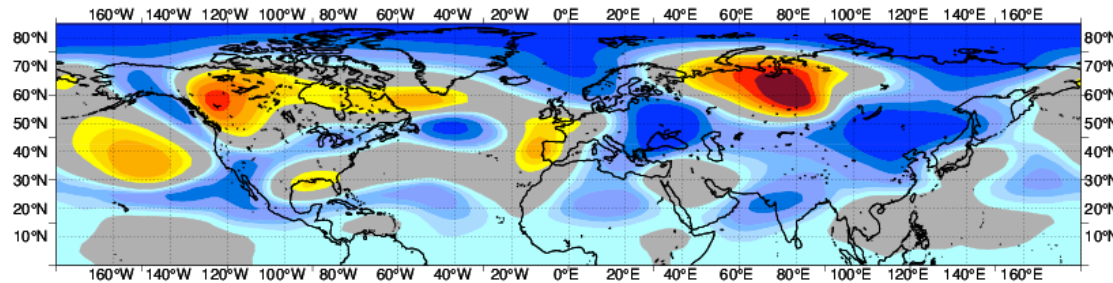

(f) Perfect model correlation skill (ACP) for ASF-20C (1981~2009)

Multi-decadal variability of Z500 **RPC** in DJF

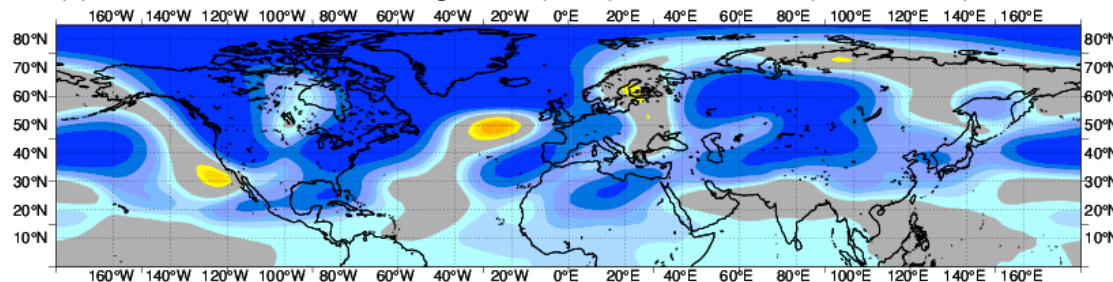

1912-1940

(a) Ratio of Predictable Component (RPC) for ASF-20C (1912~1940)

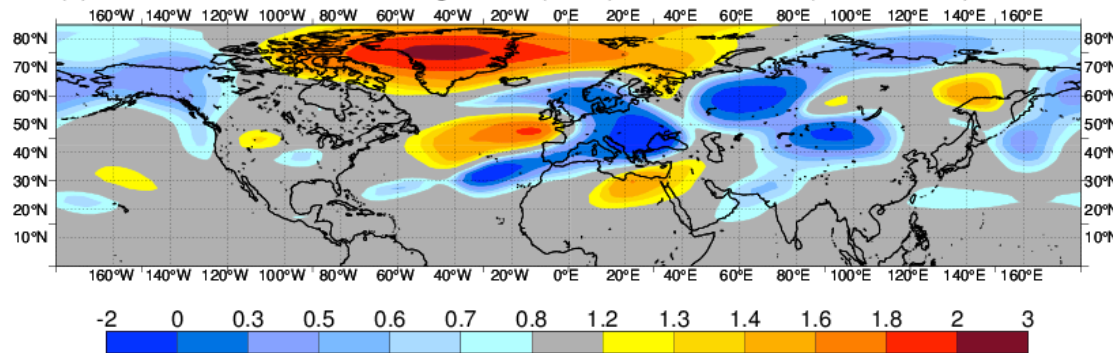

1942-1970

(c) Ratio of Predictable Component (RPC) for ASF-20C (1942~1970)

1981-2009

(e) Ratio of Predictable Component (RPC) for ASF-20C (1981~2009)

Weisheimer et al. (QJ, 2018, under rev.)

RPC – Ratio of Predictable Components
(the signal-to-noise “paradox”)

$$RPC = \frac{PC_{obs}}{PC_{model}} \geq \frac{r(obs, ens\ mean)}{\sqrt{VAR_{signal}/VAR_{total}}}$$

see *Eade et al (GRL, 2014)*

PC: predictable parts of the total variance

PC_{obs}: predictable component of the observations

PC_{model}: predictable component in the model

- Perfect model ensemble: **RPC==1**
- **RPC > 1** → underconfidence
(overdispersive);
model underestimates real-world predictability
- **RPC < 1** → overconfidence
(underdispersive);
model predictability is larger than in real world

How confident are predictability estimates of the NAO?

The NAO predictability of the real world is not (only slightly) underestimated in Century-long uncoupled (coupled) hindcasts.

Multi-decadal variations in PNA skill and teleconnections from the tropics

- Weakening of the obs. relationship between NINO3 SSTs and PNA during the mid-Century period
- Model PNA response to NINO3 SSTs is very stable over time (no weakening)
 - Lack of PNA skill in the mid-Century period

20th Century NAO/AO forecast skill and changes in tropical forcings?

Statistical NAO forecasts

Fletcher & Saunders (*J. Clim.* 2006)

ARPEGE 20CR reforecasts

(*Clim. Dyn.* 2018)

Observed rainfall – NINO4 links in Taiwan

observed precip in
Taiwan (22-25°N)
NINO4 SST

Huang et al.
(*Clim. Dyn.* 2018)

Summary and Conclusions

Distinct multi-decadal variability of winter NAO forecast skill in coupled and uncoupled hindcasts over the 20th Century (1901-2010)

- Significant skill for early decades ($r \sim 0.4$) followed by lack of skill in mid-Century ($r \sim 0.1$) and significant skill for most recent decades ($r \sim 0.5$)
- NAO predictability of the real world is not (*only slightly*) underestimated in the uncoupled (*coupled*) hindcasts over the full 110 years

Strong co-variability of NAO and PNA forecast skill with lack of skill in mid-Century

Relationship between tropical Pacific SSTs and PNA during mid-Century: strong weakening in observations which is not captured by the models

- **Short hindcast period are not sufficiently representative for longer-term behaviour (skill, confidence) due to decadal climate variability**
 - Mid-Century period stands out as an important period on which to test the performance of future seasonal forecast systems**
- **Achieving good forecast skill for recent decades is not sufficient to guarantee similar good performance in the future** (due to e.g. alterations of predominant phase of the NAO or changes to strength of tropical forcings or others)

Figure 5. (a) Time series of DJF-mean central tropical Pacific SST anomalies of annual (light blue) and 30-year average (dark blue) data and their variability during moving 30-year windows (black line) in HadISST (Rayner *et al.*, 2003) for the Niño 3.4 index. (b) The annual and 30-year mean PDO index (from <https://www.ncdc.noaa.gov/teleconnections/pdo/>).
