# Session C-2 North Atlantic atmosphere and ocean circulation

# Challenges associated with understanding changes and projections in the North Atlantic

- The response of North Atlantic atmospheric circulation to increases in greenhouse gas concentrations is still highly uncertain.
- A large discrepancy has been reported between observed and modelled changes in the atmospheric circulation in the North Atlantic area.
- In order to gain confidence in their projections, it is essential to evaluate climate models relative to observations.
- It can be difficult to compare circulation trends in models and observations because internal variability plays a large role on multidecadal timescales -> Large ensembles could help.
