# Copernicus Climate Change Service

## CDS content portfolio

Climate  
Change

## The C3S mission

To support European adaptation and mitigation policies by:

- Providing consistent and authoritative information about climate
- Building on existing capabilities and infrastructures (nationally, in Europe and worldwide)
- Stimulating the market for climate services in Europe

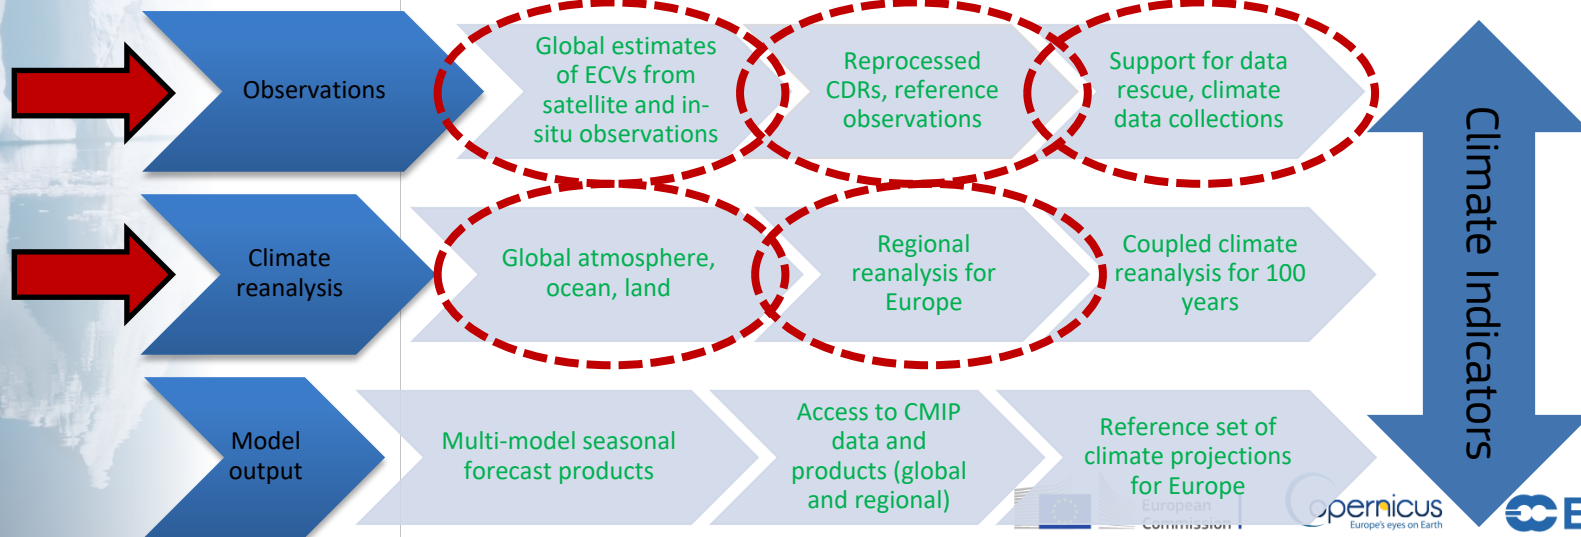

Climate  
Change

# Climate Data Store content

## Scientific basis:

- Essential Climate Variables as defined by GCOS
- GCOS Status Report and Implementation Plan
- IPCC, CMIP

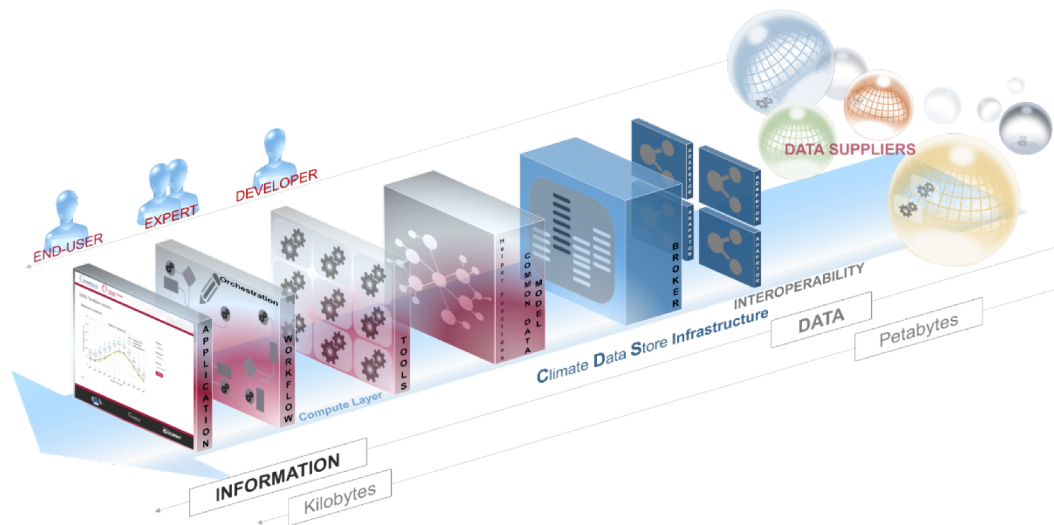

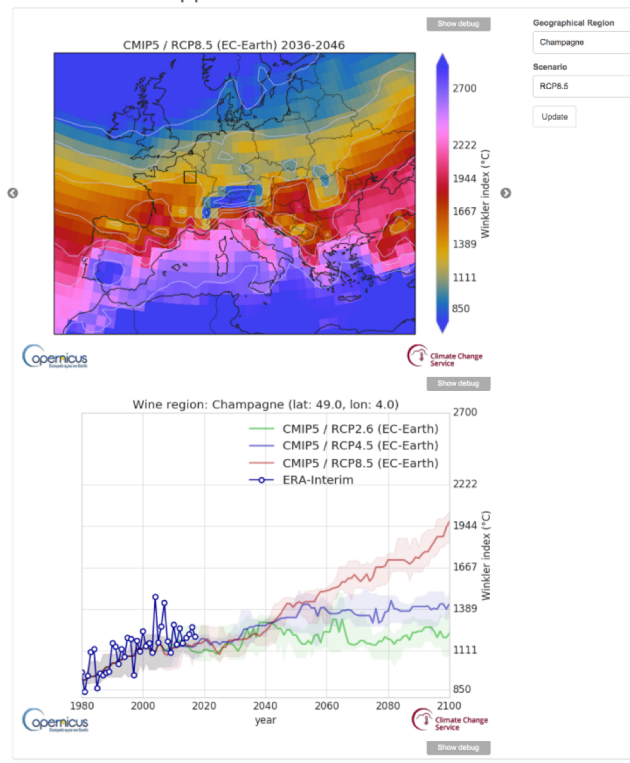

Climate  
Change

# C3S infrastructure

## CDS concept: Access to tools, workflows and applications

CDS Toolbox App.

The CDS and its Tool Box allows managing and handling “climate objects” in a seamless way and within a unified environment.

### Glaciers elevation and mass change data from 1894 to 2014 from the Fluctuation of Glaciers Database

A glacier is defined as a perennial mass of ice, and possibly firn and snow, originating on the land surface from the recrystallization of snow or other forms of solid precipitation and showing eviden...

### Albedo, leaf area index and fraction absorbed of photosynthetically active radiation 10-daily gridded data from 1999 to present

This dataset provides global Earth surface albedo reflectance and the albedo reflectance related products: Leaf Area Index (LAI) and FAPAR (Fraction Absorbed of Photosynthetically Active Radiation)...

### Sea level daily gridded data for the Mediterranean Sea from 1993 to present

Sea level anomaly is the height of water over the mean sea surface in a given time and region. In this dataset sea level anomalies are computed with respect to a twenty-year mean reference period (199...

### Sea level daily gridded data for the Black Sea from 1993 to present

Sea level anomaly is the height of water over the mean sea surface in a given time and region. Up-to-date altimeter standards are used to estimate the sea level anomalies with a mapping algorithm dedi...

### Glaciers extent data from 1995 to 2015 from the Randolph Glacier Inventory

A glacier is defined as a perennial mass of ice, and possibly firn and snow, originating on the land surface from the recrystallization of snow or other forms of solid precipitation and showing eviden...

### Ozone monthly gridded data from 1970 to present

This dataset provides estimates of the montly mean values of the ozone concentration, mixing ration and content over the globe from a large set of satellite sensors. Most of the ozone data products in...

# C3S and EUMETSAT Satellite Application Facilities (SAFs)

Several ECV products are brokered from the SAFs.

OSI SAF:

- Sea-ice concentration

ROM SAF:

- Tropospheric water vapour

CM SAF:

- Upper-troposphere humidity
- Surface radiation
- Cloud properties

## Sea ice monthly and daily gridded data from 1978 to present

Overview

Download data

Documentation

This dataset provides daily values for sea ice **concentration**, sea ice **edge** and sea ice **type** and monthly values for sea ice **thickness**. These four variables are important markers for climate change studies since sea ice greatly influences the surface albedo and exchanges of energy, moisture and carbon. The sea-ice distribution, including polynyas and margins, also has an important influence on marine ecosystems. Changes in the distribution of sea ice affect these ecosystems and a number of activities such as shipping, logistic and tourist operations.

Sea ice edge, sea ice concentration and sea ice type were computed from satellite passive microwave brightness temperatures from the series of SMMR, SSM/I and SSMIS sensors. Sea ice thickness were computed from Ku-Band radar altimeter measurements collected during the Envisat and CryoSat-2 satellite missions. Ice thicknesses from Envisat satellite (October 2002 to October 2010) have less coverage and higher uncertainty than thicknesses from CryoSat-2 satellite (November 2010 - March 2015), however the combined dataset provides a valuable unique observational record of sea ice variability.

From 1978 up to April 2015 the data records provided by this dataset have sufficient length, consistency, and continuity to detect climate variability and change. From April 2015 onwards, satellite data were processed using the same algorithms and processing environment but consistency and continuity have not been extensively verified.

This dataset is produced on behalf of C3S, with the exception of sea ice concentration which is produced at the EUMETSAT Satellite Application Facility on Ocean and Sea Ice (OSI SAF).

More details about the product are given in the Documentation section.
